

BASELINE STUDY COORDINATION

Baseline surveys are a critical step that should be undertaken before the commencement of a new development. Baseline information is used to identify and understand local environmental and heritage values of an area. This information forms a significant part of any Environmental Impact Assessment (EIA) or environmental approvals process.

The baseline assessment process can be long and challenging for proponents, with many factors to consider and numerous surveys to commission. Poor management of approvals and baseline surveys can be costly and waste valuable time, adversely affecting development timelines. Individually and as a team, our environmental specialists have managed and coordinated baseline environmental surveys for proponent's right across Western Australia.

When it comes to managing and coordinating baseline environmental surveys, we take the pressure off our clients to allow them to focus on other aspects of the project development. In doing this, we provide the following:

- Weekly and monthly updates and progress reports on the survey progress
- Day-to-day liaison with survey providers to ensure everything runs smoothly
- Provide a single compiled package after the survey that includes all spatial data and reports generated
- Review of draft reports
- Approach survey providers for quotes and costed proposals
- Check invoices against purchase orders and proposals
- Review of spatial data and IBSA data package

We have excellent working relationships with a broad range of consultants across all disciplines throughout Western Australia. Please contact us to discuss your project further, and how we can assist.
